

Anonymity in social media

Saptarshi Ghosh
and Mainack Mondal

CS 60017
Autumn 2019

So far we covered

- Advertising systems
 - Why should we bother about them?
 - How these ad interfaces can be abused?
- Preserving privacy in social media from background actors
 - K-anonymity
 - Differential Privacy
- Preserving privacy in social media from other users
 - Privacy definitions
 - Exposure control

Now let's go a bit more into the what of privacy

- Recall westin's defintion
 - the claim of individuals, groups, or institutions to determine for themselves when, how, and to what extent information about them is communicated to others.
- He defined four states of privacy

Now let's go a bit more into the what of privacy

- Recall westin's defintion
 - the claim of individuals, groups, or institutions to determine for themselves when, how, and to what extent information about them is communicated to others.
- He defined four states of privacy
 - Solitude: being free from observation by others

Now let's go a bit more into the what of privacy

- Recall westin's defintion
 - the claim of individuals, groups, or institutions to determine for themselves when, how, and to what extent information about them is communicated to others.
- He defined four states of privacy
 - Solitude: being free from observation by others
 - Intimacy: limiting communication within a small group

Now let's go a bit more into the what of privacy

- Recall westin's defintion
 - the claim of individuals, groups, or institutions to determine for themselves when, how, and to what extent information about them is communicated to others.
- He defined four states of privacy
 - Solitude: being free from observation by others
 - Intimacy: limiting communication within a small group
 - Reserve: desire to limit information disclosure to others and others respecting that desire

Now let's go a bit more into the what of privacy

- Recall westin's defintion
 - the claim of individuals, groups, or institutions to determine for themselves when, how, and to what extent information about them is communicated to others.
- He defined four states of privacy
 - Solitude: being free from observation by others
 - Intimacy: limiting communication within a small group
 - Reserve: desire to limit information disclosure to others and others respecting that desire
 - Anonymity: freedom from identification and from surveillance

Now let's go a bit more into the what of privacy

- Recall westin's defintion
 - the claim of individuals, groups, or institutions to determine for themselves when, how, and to what extent information about them is communicated to others.
- He defined four states of privacy
 - Solitude: being free from observation by others
 - Intimacy: limiting communication within a small group
 - Reserve: desire to limit information disclosure to others and others respecting that desire
 - Anonymity: freedom from identification and from surveillance

**Anonymous social media site:
whisper** (based on Correa et al.'s ICWSM'15 paper)

Anonymous Online Social Media sites

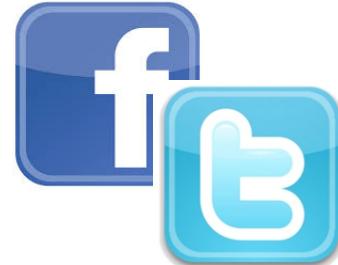

Traditional Online social networks are very popular

284 million monthly active Twitter users

500 million tweets per day

These social networks are non-anonymous

Requires unique usernames and profile information

However **anonymous social networks are emerging**

Whisper, secret.ly, Yik Yak

No unique usernames or profile information

Whisper: example of Anonymous social media site

Whisper: popular anonymous OSN

Launched in March 2012

2M+ users, 2.5B+ page views

Age group 17-28 years

Anonymous social media site

No unique username

No profile information

Post messages via mobile

Read-only web interface

Posts are called **whispers**

Whisper: example of Anonymous social media site

Whisper: popular anonymous OSN

Launched in March 2012

2M+ users, 2.5B+ page views

Age group 17-28 years

Anonymous social media site

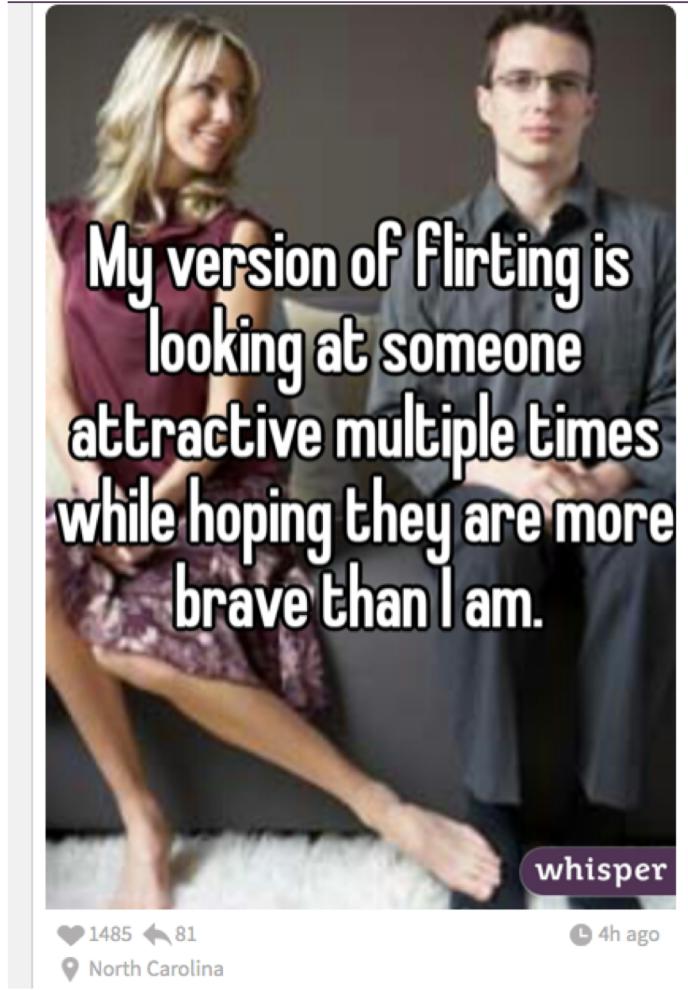

No unique username

No profile information

Post messages via mobile

Read-only web interface

Posts are called **whispers**

Characterizing anonymous social media content

These sites are very new and growing fast

Very little work on how users use this platform

Are these sites different than the existing non-anonymous social media sites?

No investigation before us into the type of content posted

Our experimental platform: Whisper

We collected data from Whisper for 3+ months

July 1 – November 17 2014

20 Millions whispers in our dataset

Texts posted by users

Pictures on which the texts are posted

Locations of 66.3% posts

We categorize whispers along four dimensions

Questions

Sensitivity: How anonymity sensitive is content posted on anonymous media sites?

Content: What types of content are posted on anonymous social media?

Audience: Do demographic variables play a role in content anonymity sensitivity?

Language: What are the linguistic differences between content posted on anonymous versus non-anonymous social media?

Questions

Sensitivity: How anonymity sensitive is content posted on anonymous media sites?

Content: What types of content are posted on anonymous social media?

Audience: Do demographic variables play a role in content anonymity sensitivity?

Language: What are the linguistic differences between content posted on anonymous versus non-anonymous social media?

How to measure anonymity sensitivity of a content?

Challenge

Anonymity sensitivity for same content differs for different users

Solution

We define **Anonymity Sensitivity Score (AS Score)**

The probability that users would call a piece of text anonymous

If 3 out of 10 users call a piece of text anonymous then AS Score is 0.3

AS Score varies from 0.0 to 1.0

Higher AS Score means more sensitive

Computing AS Scores of social media content

We picked 500 random tweets, 500 random whispers

Asked 100 AMT workers to label each text anonymous or not

What is AMT?

Amazon Mechanical Turk: A crowdsourcing platform

Crowdsourcing

What is AMT?

collaborative approach for acquiring annotated corpora

The requester floats jobs (identify objects in a picture)

The workers do those jobs

The requesters pay the workers via AMT platform

Crowdsourcing: Why

Paid for crowdsourcing can be 33% cheaper than in-house employees when applied to tasks such as tagging and classification (Hoffmann, 2009)

Participants (workers) are paid money to complete easy tasks
(HIT = Human Intelligence Task)

Contributors are extrinsically motivated through economic incentives

Most NLP/AI/ML projects use crowdsourcing : AMT and CrowdFlower

Great for labelling data (does this post contain sensitive data?)

Can even get survey responses (Do you want to change privacy of your facebook posts?)

Computing AS Scores of social media content: Continued

We picked 500 random tweets, 500 random whispers

Asked 100 AMT workers to label each text

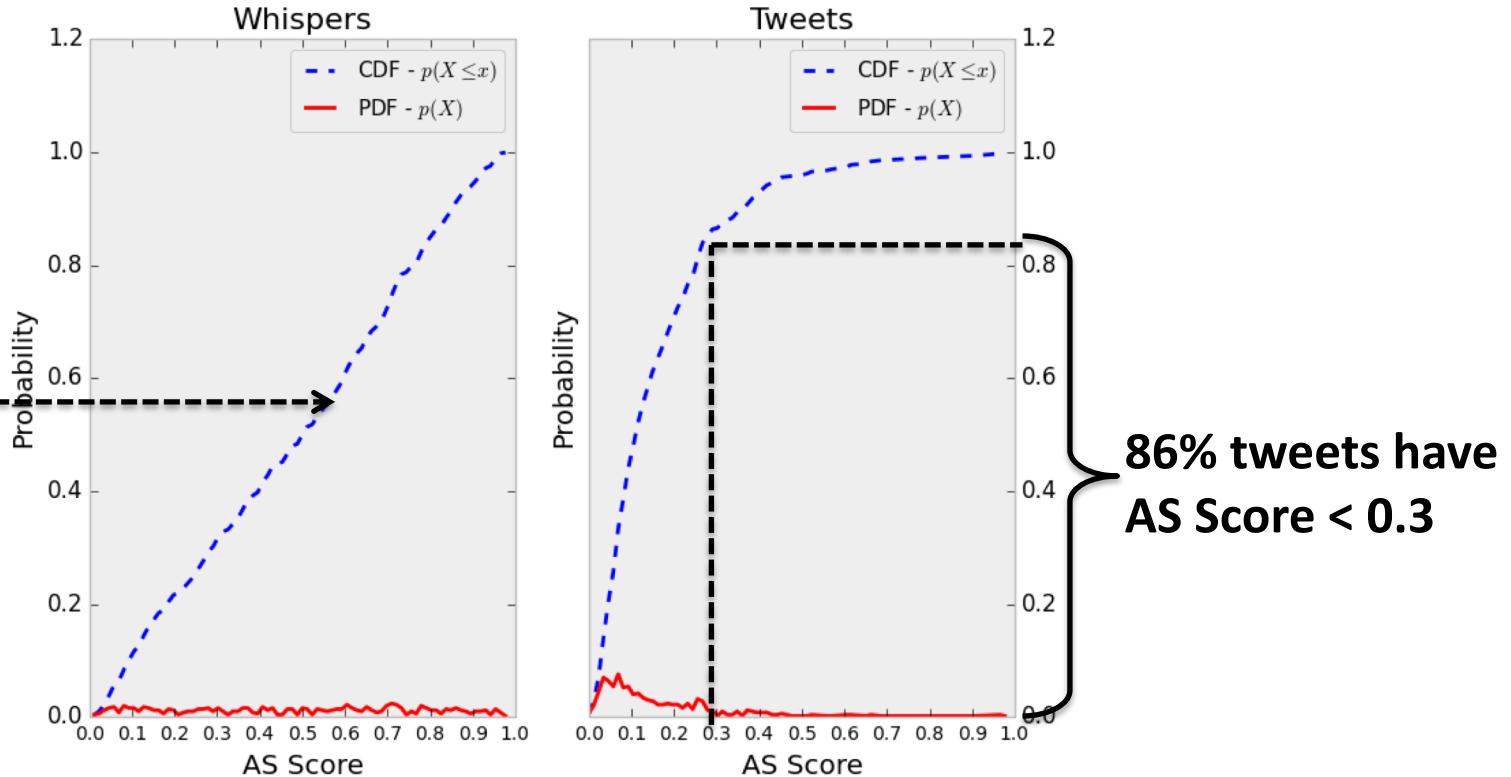

Question: if you would have made this post would you post it anonymously or non-anonymously?

Computed AS Score for each of the text

AS Score	Sample text
0.0	absolutely roastin today!!!! im dying lol x
0.5	Is it to late to join a beer softball league?
1.0	I suck at sexting! 19y female.

Are the AS Scores of anonymous and non-anonymous social media posts different?

similar fraction of whispers for all AS Scores

Anonymous media content have higher AS Scores (overall)

Not all anonymous media content is equally sensitive

Categorization dimensions

Sensitivity: How anonymity sensitive is content posted on anonymous media sites?

Anonymous media content are more sensitive

Content: What types of content are posted on anonymous social media?

Audience: Do demographic variables play a role in content anonymity sensitivity?

Language: What are the linguistic differences between content posted on anonymous versus non-anonymous social media?

Categories for classifying content

We create 9 categories inspired by Whisper categories

We asked 5 AMT workers to classify 500 random whispers

93.8% Whispers are captured by the 9 provided category

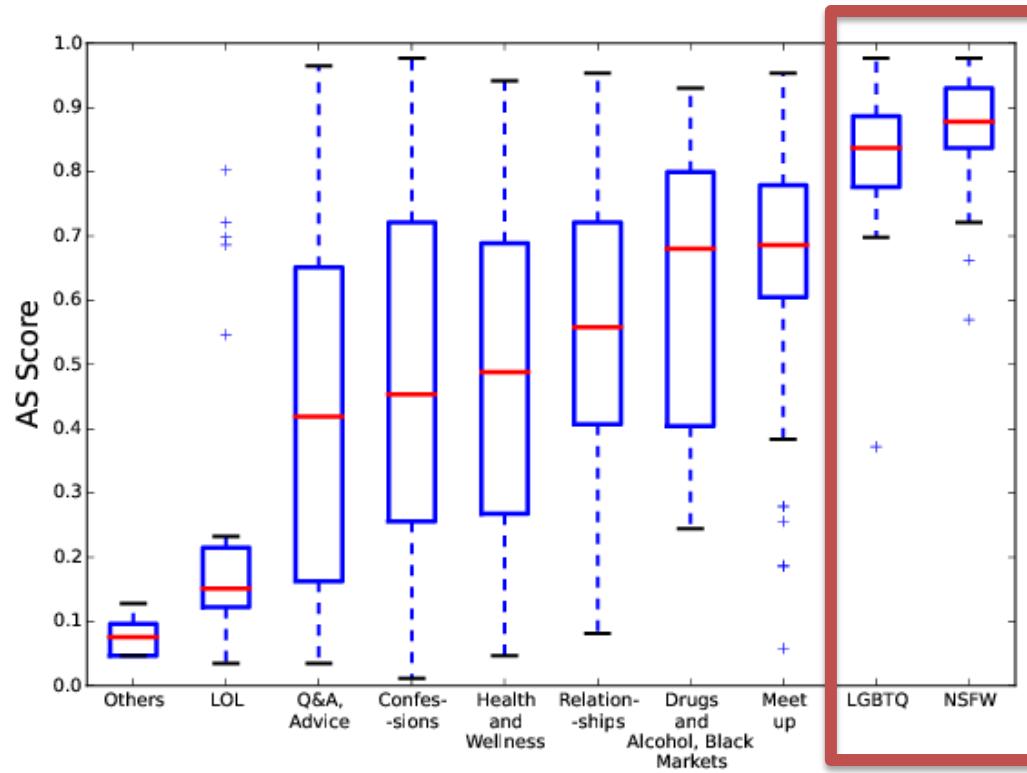

Category	Example
Confessions	I told everyone I loved my job as a lifeguard when I actually hated it, I just liked being tan
Relationships	My mother wants me converse more with her. Yet when I try, the discussion turns to me being fat, useless and pathetic. She wonders why I don't speak to her.
Meetup	any ladies 18+ want a new snap friend? 30/m here...
QnA/Advice	is it okay that I'm a virgin at 17?
NSFW	boobs <3
LGBTQ	If you're trans and reading this, have a hug from me.
Health and Wellness	Having depression and anxiety really sucks... :(
LOL	Each time I see a whisper on the popular page I think damn why didn't I think of that
Drugs and alcohol, black markets	I smoke weed everyday

What type of content is posted in whisper?

Category	percentage of whispers
Confessions	56.8
Relationships	24.7
Meetup	17.8
QnA/Advice	14.4
NSFW	7.1
LGBTQ	5.0
Health and Wellness	5.0
LOL	4.8
Drugs and alcohol, black markets	2.5

Most of anonymous social media content is classified as confessions, relationships, meet up or Q&A/Advice.

Are these different types of content equally sensitive?

Posts in NSFW and LGBTQ are significantly more anonymity sensitive than others

Categorization dimensions

Sensitivity: How anonymity sensitive is content posted on anonymous media sites?

Anonymous media content are more sensitive

Content: What types of content are posted on anonymous social media?

Mostly confessions, relationships, meetup, advices

Audience: Do demographic variables play a role in content anonymity sensitivity?

Language: What are the linguistic differences between content posted on anonymous versus non-anonymous social media?

How demographically diverse is our AMT worker base?

Our AMT workers voluntarily submitted data about demographics

Some basic demographic statistics

We have workers mainly from US

Median age of our users: 32

male-female ratio same as in whole US (0.95)

39.5% of our AMT workers have graduated from college

Our AMT workers have a wide income range

Median income 27k USD per annum

Correlation between user demographics and content sensitivity

We check the difference between the AS Scores assigned by different demographic groups of our AMT workers

Key findings

Gender affects anonymity sensitivity only for **NSFW content**

Older users are more anonymity sensitive than younger users

College Education increases anonymity sensitivity

Categorization dimensions

Sensitivity: How anonymity sensitive is content posted on anonymous media sites?

Anonymous media content are more sensitive

Content: What types of content are posted on anonymous social media?

Mostly confessions, relationships, meetup, advices

Audience: Do demographic variables play a role in content anonymity sensitivity?

Yes, gender, age, education effects sensitivity

Language: What are the linguistic differences between content posted on anonymous versus non-anonymous social media?

Linguistic differences between anon. and non-anon. content

We sample 100,000 random whispers and tweets

We used Linguistic Inquiry and Word Count (LIWC) - hierarchical linguistic lexicon with 70 categories

biological, positive/negative emotion, Personal Concerns

Key findings

Whispers have **more personal, social and informal** words than tweets

Words in Whisper communicate **more negative emotions** than tweets

Whispers express **more wants, needs and wishes**

Can we automatically suggest user what is a possible anon social media content based on linguistic characteristics?

Can we detect anonymous social media content using language?

We tried to build a classifier using LIWC labels as features

Our train and test set consists of 100K random whispers and 100K random tweets

Used 10-fold cross validation to validate classifier

Our classifier achieved a F1 score of 72.88%

A good first step, but we can possibly improve it in future

Identity Representation

pseudonyms

Mark Zuckerberg

Pseudonyms and multiple accounts demonstrate “a lack of integrity”

Google

“The web means
the end of forgetting.”
— New York Times

Identity Representation

Archiving Strategy

Mark Zuckerberg

Pseudonyms and multiple
accounts demonstrate
“a lack of integrity”

Identity Representation

Millen 2000

Archives are highly valued and expected to be read by newcomers.

Archiving Strategy

Millen + Patterson 2003

Real names and pseudonyms “promote trust, cooperation and accountability.”

Identity Representation

What happens in a
large scale
anonymous, ephemeral
community?

Archiving Strategy

Ma + Agarwal 2007

Strong identity and permanent archives correlate with satisfaction and participation

Identity Representation

How does such a community produce so much of the Internet's shared culture?

Archiving Strategy

Ma + Agarwal 2007

Strong identity and permanent archives correlate with satisfaction and participation

Identity Representation

4chan /b/

Archiving Strategy

Ma + Agarwal 2007

Strong identity and permanent archives correlate with satisfaction and participation

Our Goal

Use 4chan /b/ as a lens
to understand the concepts
of anonymity and ephemerality.

Our Argument

Anonymity and ephemerality support community behaviors that generate internet culture.

>>

sage 07/20/11(Wed)15:30:34 No.33973454556

“sage” in email field leaves a reply without bumping the thread: “burying” a thread

0.77% of posts were sages

>>

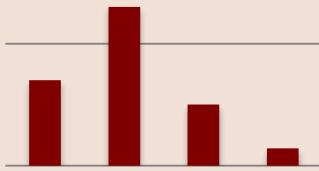

Interpretation 07/20/11(Wed)15:30:34

4chan members play within the bounds of ephemerality and manipulate it

Ephemerality Discussion

>>

Volume comparisons 07/20/11(Wed)15:30:34

35,000 threads and 400,000 /b/ posts per day
vs. 7,100 digg threads per day
25,000 usenet posts per day
65,000 youtube videos per day

[Szabo+Huberman 2010, newsadmin.com]

>>

Alternate Archives 07/20/11(Wed)15:30:34

users save memorable content
to /b/ folders on their hard drives

4chanarchive.org for “epic” threads

Ephemerality Discussion

>>

Role in meme creation 07/20/11(Wed)15:30:34

fast pace leads to continuously fresh content
no history may mitigate “rich get richer” phenomena

>>

Raising participation? 07/20/11(Wed)15:30:34

counterintuitively, ephemerality may actually
be increasing participation in /b/

participating in a thread is the best way
to keep it from 404ing

Study 2

Anonymity

Anonymity on 4chan

The screenshot shows a 4chan post submission interface. On the left, there are several input fields: Name, E-mail, Subject, Comment, Verification, File, and Password. The Verification field contains the text "Merad immune". Below these fields is a CAPTCHA image with the text "Merad immune" and a text input field next to it. To the right of the CAPTCHA is the reCAPTCHA logo with the tagline "stop spam, read books.". Two large red arrows point from the right side of the slide towards the CAPTCHA area.

Name	<input type="text"/>
E-mail	<input type="text"/>
Subject	<input type="text"/>
Comment	<input type="text"/>
Verification	<input type="text"/> Merad immune
File	<input type="button" value="Choose File"/> No file chosen
Password	<input type="password"/> (Password used for file deletion)

Supported file types are: GIF, JPG, PNG
Maximum file size allowed is 2048 KB.
Images greater than 250x250 pixels will be thumbnailled.
Read the rules and FAQ before posting.

4chan and /b/:

An Analysis of Anonymity and Ephemerality in a Large Online Community

Abstract

We present two studies of ephemerality and anonymity online using the popular discussion board *4chan* at 4chan.org, where users can post anonymously and place an identifier in their comments. Although researchers and practitioners have often argued that user identity and data permanency are central tools in the design of online communities, we explore how *4chan* succeeds despite being based entirely anonymous and extremely ephemeral.

We begin by examining the nature of posts on *4chan* and find that they are highly ephemeral. In our first study, we find that 4chan users are more likely to post anonymously than other users on the Internet. This finding suggests that users on *4chan* are more willing to be anonymous than other users.

We then examine the nature of posts on *4chan* and find that they are highly ephemeral. In our second study, we find that users on *4chan* are more likely to post anonymously than other users on the Internet. This finding suggests that users on *4chan* are more willing to be anonymous than other users.

Readers may know of *4chan* and */b/* from their influence on Internet culture and media coverage of their off-site activities. *4chan* is a prolific meme factory, originating popular memes like LOLcats (Rothkopf 2007) and nekkidling (Lekach 2009). Additionally, some *4chan* and */b/* members are involved in highly visible offline activism. These activists include coordinating *Time Magazine*'s poll to elect its founder the "World's Most Influential Person" (Time Staff 2009) and participating in hacktivist group "Anonymous". Anonymous has executed highly visible protests of the Church of Scientology (Coleman 2011) and DDoS attacks against Mastercard and Paypal in support of WikiLeaks (Wikileaks 2010). While these events have brought the more positive media attention (Boggs-Warren 2006), harassment and activism have often been negatively and sensationalized covered in the media (e.g., *4chan* is the "internet hate machine," says Phil Shamu on Fox News [2010]), and many media outlets have seized on the negative aspects of *4chan* (e.g., Lekach 2010; Poole 2010). Much of this coverage is in response to *4chan*'s distinctive culture – a culture that merits critical analysis beyond the scope of this paper. Here, we focus on the board's design choices of anonymity and ephemerality, and how they may support or influence this culture.

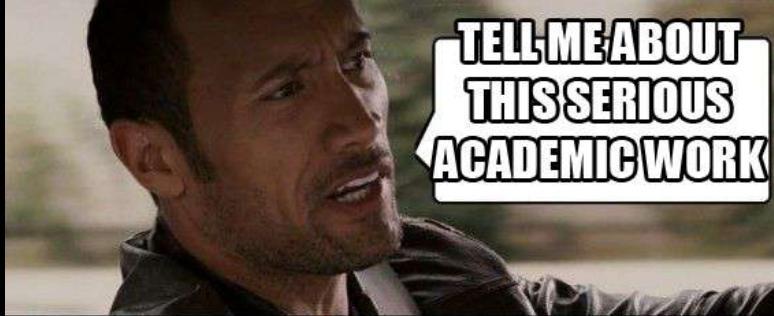

In this paper, we perform a content analysis and two derivative studies of *4chan*, focusing on anonymity and ephemerality. In our first study, we use a dataset of 5.5 million posts

RATE ME /B/

Introduction

Researchers and practitioners have often argued that user identity and data permanency are central features to the design of an online community. Real names and pseudonyms can help "protect trust, communication, and accountability" (Miller and Parham 2003), whereas anonymity will make communication impersonal and undermine credibility (Hiltz and Johnson 1998; Rains 2007). Influential industry players like Facebook argue that pseudonyms and multiple identities show a lack of integrity (Kirkpatrick 2010). Similarly, data permanency is the norm. Quicksilver sites are constructed with the hope of "preserving organizational memory" (Ackerman 1994); communities highly value their searchable archives (Miller 2000), and search engines make content findable years after it is created (Rosen 2010).

While some argue that anonymous contributions and ephemeral participation online can be desirable (Larose Copyright © 2011, Association for the Advancement of Artificial Intelligence (www.aaai.org). All rights reserved.

Find it funny or weird 07/20/11(Wed)15:30:34 No. 2832974298

ITT: /b/ gets trolled by the MIT

I bet the FBI paid MIT to study us

That's the britfags' tax money at work lol, paying scientists to fap over Emily Watson fakes

Lol at how formally they present what goes on here. Like newt gingrich is some isolated tribe in the rainforest with unique and primitive customs.

Engaged with the content 07/20/11(Wed)15:30:34 No. 2832974298

skimmed the whole paper. interesting. i especially like seeing the breakdown of what types of threads are posted most. I would like to see the themed section broken down ie. 20% CP 8% furfag 17% raff u roose 2% fingerbox 5% sup my name is john and you're all a bunch of candy-ass s

This is... This is actually pretty damn interesting.

I think something is lost to the analysts here. The fact that one of the most popular /b/ activities is "pissing into the sea of piss".
